List of new activities/classes created:

1. ResultDisplayActivity
2. Favorite
3. FavoriteDataSource
4. FavoriteDisplay
5. MySQLiteHelper

ResultDisplayActivity receives the title, date, text and imageURL from the main activity using and intent.

Favorite is used to create favorite objects. It consists of id, title, date, image and url. In this submission, only the title and id methods are implemented.
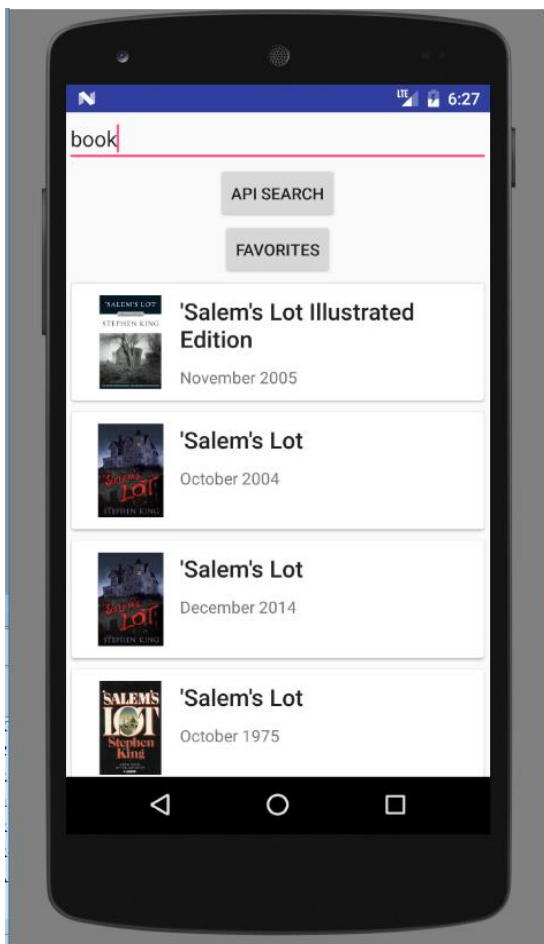

FavoriteDataSource is used as a data access object (DAO).

FavoriteDisplay is an activity used to display a list of titles which are favorited.
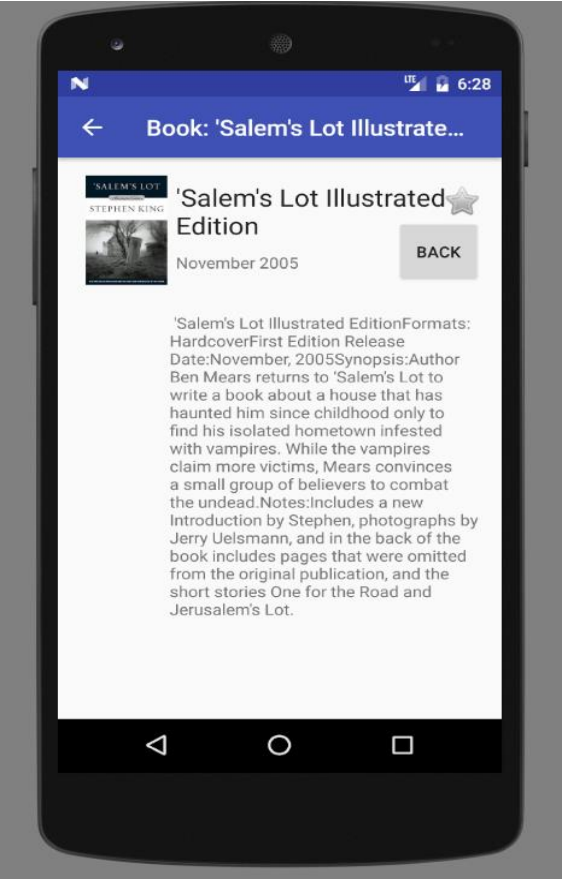

MySQLiteHelper is responsible for creating the database.

The following are screenshots of the various activities:

Main Activity

FavoriteDisplay:

The back button in the taskbar takes you to main with no search results displayed.
The back button I have added allows you to select other search results.

Note:
There are various fragments of code which do not work in this version of the app. I will be working on them and try to submit again before the deadline.
My current submission has no errors and I have imported and run them on the emulator with no hiccups.
